-!- FUNCTION: SEEMS NECESSARY FOR VIRAL DNA REPLICATION, PLAYS AN IMPORTANT ROLE IN THE REGULATION OF CAPSID GENE EXPRESSION. IT IS COVALENTLY BOUND TO THE 5'TERMINI OF VIRAL DNA, AND CAN IMPLENCE DNA PACKAGING. NSI IS ALSO BELIEVED TO POSSESS THE TOPOLSOMERASE I TYPE NICKING ACTIVITY, AND CYTOTOXIC ACTIVITY.

actor. OCIF; heparin; bone resorption; Ochizuki S, Morinaga T; d, Yano K, Yasuda H;	N-PSDB; 136685.  N-PSDB; 136685.  DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis for bone resorption control, esp. treatment of osteoporosis for bone resorption control, sp. dayersents the mature osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. Sequence 380 AA;		etfppkylhydeetshqllcdkcppgtylkghctakwktvcapcpdhyytdswhtsdecl 	ysspyckelgyvkgecnrthnryceckegryleiefolkhrsoppgfgyvgagtpernty

This sequence represents the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

This sequence represents acir-C19S in which the 19th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchanges or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption and therefore in the control of disorders of bone resorption, e.g.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoprosis claim 31. Page 96-98. 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C20S in which the 20th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 35; Page 98-100, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C21S in which the 21st Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. Or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-APR-1997 (first entry)
Mutated OCIF, OCIF-C21S.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim [6.2] Page 117-119; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CL in which amino acids 379-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 38: Page 100-102, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C22s in which the 22nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SSS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchanges or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore

osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C235 in which the 23rd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. C. and ins at 56 deg. C, and is lost after 10 mins at 90 deg. C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

DNA encoding osteoclastogenesis inhibitory factor protein - useful DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 80: Page 126-128; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CEBst in which Gln 371 is substituted by sequence represents OCIF-CEBst in which Gln 371 is substituted by the changes are caused by the introduction of a restriction site in the DNA encoding this protein. The OCIF of the invention has a can molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                23-APR-1997 (first entry)
Mutated OCIF, OCIF-CBst.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    22 etfppkylhydeetshqllcdkcppgtylkqhctakwktvcapcpdhyytdswhtsdecl 81

Claim 44; Page 105-107; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCRI in which amino acids 2-42 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 bunder reducing conditions and 120 kb under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. C or 30 mins at 56 deg. C, and is lost after 10 mins at 70 deg. G oCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human tumour necrosis factor receptor - used to develop prods. for treating e.g. tumours, infection, auto:immune disease, graft rejection, cytocoxicity or inflammation

Claim 14; Fig 1; 59pp; Eaglish.

The receptor binds to TNF, and in particular, TNF-beta.

The receptor may be used for screening for antagonists and agonists of the receptor may be used for screening for antagonists and agonists of the receptor and for ligands for the receptor. Such agonists may be used to inhibit the growth of tumours, to stimulate cellular differentiation, to mediate the immune response and anti-viral response, to regulate growth and provide resistance to certain infections. The antagonists may be used therapeutically, to treat autoimmune diseases, inflammation, septic shock, to inhibit graft-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   82 ycspyckelqyykqecnrthnrvceckegryleiefclkhrscppgfgvvqagtperntv 141

ON encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 65; page 119-121; 183pp; Japanese.
Claim 65; page 119-121; 183pp; Japanese.
Claim 65; page 119-121; 183pp; Japanese.
This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CC in which amino acids 331-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 YCSPVCKELQYVKQECNRTHNRVCECKEGRYLEIEFCLKHRSCPPGFGVVQAGTPERNTV 120

to the control of the control, esp. treatment of osteoporosis claim 83; Page 128-129; 183pp; Japanese.

Claim 83; Page 128-129; 183pp; Japanese.

This sequence represents a mutated version of the full length response to the control of the invention. This sequence represents octr-csph in which amino acids 298-380 of the mature sequence represents Octr-csph in which amino acids 298-380 of the mature coult protein are replaced by Ser-Leu-Asp. These changes are caused by the introduction of a restriction site in the DNA encoding this protein. The OCTF of the invention has a molecular weight by SDS-PAGE of 60 kD more reducting conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. C or 30 mins at 56 deg.C, and is lost resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 YCSPVCKELQYVKQECNRTHNRVCECKEGRYLEIEFCLKHRSCPPGFGVVQAGTPERNTV 120

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 47: Page 107-109: 1838p; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions.

No Fabragian Statement of the protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 50, Page 109-111, 183pp, Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents of OCIF-DCRS in which amino acids 85-122 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions. The protein is adsorbed onto action exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C or 30 mins at 66 deg.C, and is lost after 10 mins at 69 control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                              Mutated OCIF, OCIF-DCR3.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 YCSPVCKELQYVKQECNRTHNRVCECKEGRYLEIEFCLKHRSCPPGFGVVQAGTPERNTV 120

##label HEU

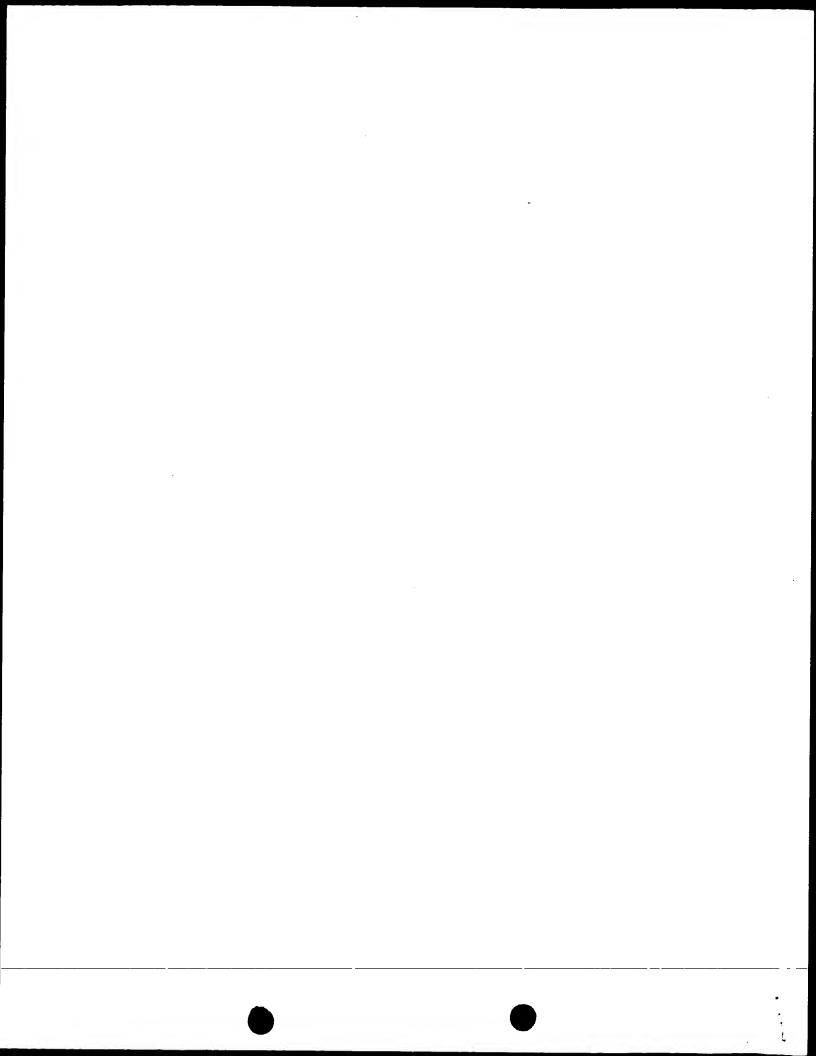

This receptor is found on sensory and sympathetic neurons, on neuroblastoma cells, and on a variety of nonneuronal derivatives of the neural crest.

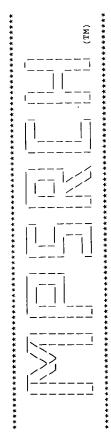

The cysteine rich region of the extracellular domain may form part or all of the NGF-binding site.

This protein is thought to form a high-affinity receptor when it associates with the 140K frk proto-oncogene, which contains an intracellular tyrosine kinase domain.

TION #superfamily nerve growth factor receptor; NGF receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         #domain signal sequence #status predicted #label SIG\

Title: >US-08-915-004-7
Description: (1-15) from US08915004.pep
Perfect Score: 113

Sequence: 1 ETFPPKYLHYDEETS 15

Scoring table: PAM 150

Searched: 101610 seqs, 12294212 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq28 |:part1 2:part2 3:part3 4:part4 5:part5 6:part6 7:part7 | 8:part8 9:part9 10:part10 11:part11 12:part12 13:part13 | 14:part14 15:part15 16:part16 17:part17 18:part18 | 19:part19 20:part20 21:part21

Statistics: Mean 19.020; Variance 64.466; scale 0.295

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNR encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 2; Page 67: 183pp; Japanese.

Claim 2; Page 67: 183pp; Japanese.

Claim 2; Page 67: 183pp; Japanese.

The sequences given in 189921-23 and 189926 represent fragments of the osteoclastogenesis inhibitory factor (OCIF) of the invention.

The OCIF has a molecular weight by SDS-PAGE of 60 kb under reducing conditions and 120 kb under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. C or 30 mins at 56 deg.C, and is bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                      22-ApR-1997 (first entry)

osteoclastogenesis inhibitory factor (OCIF) of the IULI length sequence represents OCIF-OF in which amino acids 62-380 of the mature OCIF protein are replaced by Leuval. These changes are caused by the introduction of a restriction site in the DNA encoding this protein. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó;

sequence represents OCIF-CCR3 in which amino acids 86-380 of the mature OCIF protein are deleted. The OCIF of the invention mature OCIF protein are deleted. The OCIF of the invention and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for bone resorption control, esp. treatment of osteoporosis
Claim 74; Page 124; 183pp; Japanese.
This sequence represents a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence represents OCIF-CCR4 in which amino acids 123-380 of the
mature OCIF protein are deleted. The OCIF of the invention
has a molecular weight by SDS-PAGE of 60 kD under reducing conditions
and 120 kD under non-reducing conditions. The protein is adsorbed onto
cation-exchangers or heparin and its activity is lowered after 10 mins
at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90
deg.C. OCIF is useful in the control of bone resorption and therefore
in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.

This sequence represents full length osteoclastogenesis inhibitory factor (OCIF) 4. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under norrequeing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is
                                                                                                                                                                                                                                                                                                                                                                                       Na result lawors.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 26; page 76-77; 183pp; Japaneses.

This sequence represents full length osteoclastogenesis inhibitory factor (OCIF) 5. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducting conditions and 120 kD under non-reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C. and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Osteoclastogenesis inhibitory factor 4. DNA encoding osteoclastogenesis inhibitory factor protein - useful DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 86; Page 130-131; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This osteoclastogenesis inhibitory factor (OCIF) of the invention. This control is confirmed are deleted. These changes are caused by the introduction of a restriction site in the DNA encoding this protein. The OCIF of invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and resorption, e.g. osteoporosis.

C This Sequence represents a mutated version of the full length

CC Steoclastogenesis inhibitory factor (OCIF) of the invention.

CC Steoclastogenesis inhibitory factor (OCIF) of the invention.

CC sequence represents OCIF-CDD2 in which amino acids 252-380 of the

CC sequence represents OCIF-CDD2 in which amino acids 252-380 of the

CC sequence represents or repeating conditions.

CC ation exchangers or heparin and its activity is lowered after 10 mins

CC ation exchangers or heparin and its activity is lowered after 10 mins

CC ation exchangers or heparin and its activity is lowered after 10 mins

CC ation exchangers or heparin and its activity is lowered after 10 mins

CC ation or CC and mins at 56 deg.C, and is lost after 10 mins at 90

CC deg.C. OCIF is useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                                                     DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 17. Page 123. Baspp. Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents offer-CDDI in which amino acids 177-380 of the mature COIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  23-APR-1997 (first entry)

The properties of the control, esp. treatment of osteoporosis.

To bone resorption control, esp. treatment of osteoporosis.

Claim 83, Page 128-139; 183pp; Japanese.

Control osteoclastogenesis inhibitory factor (OCIF) of the full length of sequence represents a mutated version of the full length of costeoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CSph in which amino acids 298-380 of the mature ocif protein are replaced by Ser-Leu-Asp. These changes are caused by the introduction of a restriction site in the DNA encoding this protein.

The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 59; Page 115-116; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DDD2 in which amino acids 253-326 of the mature oCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto
                                                                                                                                                                                                                                                                                                                                                                                                                                                  National Market No. 1991, 1991, 1992, treatment of osteoprorosis for bone resorption control, esp. treatment of osteoprorosis for bone resorption control, esp. treatment of osteoprorosis for bone resorption control, appeares the sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DDD1 in which amino acids 178-252 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto extinon-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

In Four in the first protein of osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis for bone resorption control, esp. treatment of osteoporosis for laim 65. Page 119-121; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CC in which amino acids 331-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 50 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                         ö
cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23-APR-1997 (first entry)

                                                                                                                                                                                                  NNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis for and 47. Page 107-109; 183pp; Japanese.

This sequence represents a mutated version of the full length osteogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR2 in which amino acids 43-84 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kB under reducing conditions and 120 kB under non-reducing conditions. The protein is adsorbed onto cation-exchanges or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of sorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                           o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                23-APR-1997 (first entry)

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR4 in which amino acids 123-164 of the mature OCIF protein are deleted. The OCIF of the invention

ö
has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis. Claim SO, Page 109-111; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR3 in which amino acids 85-122 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption and therefore in the control of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

New human tumour necrosis factor receptor - used to develop prods.

Tor treating e.g. tumours, infection, auto:immune disease, graft rejection, cytotoxicity or inflammation

Sclaim 14. Fig 15 59pp; English.

The receptor binds to TNF, and in particular, TNF-beta.

The receptor may be used for screening for antagonists and agonists of the receptor may be used for screening for antagonists and agonists of the receptor may be used for liquids for the receptor. Such agonists may be used to inhibit the growth of tumours, to stimulate cellular differentiation, to mediate the immune response and anti-viral response, to regulate growth and provide resistance to certain infections. The antagonists may be used therapeutically, to treat autoimmune diseases, inflammation, septic shock, to inhibit graft.

Sequence 390 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 6; Page 62-64; 183pp; Japaneses.

This sequence represents the mature osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE Of 60 kb under reducing conditions and 120 kb under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C., and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            05-MAY-1997 (first entry)
Human tumour necrosis factor receptor.
Tumour necrosis factor TNF; receptor; TNF-beta; ligand; tumour:
differentiation; immune response; autoimmune disease; inflammation; septic shock; graft-versus-host; apoptosis.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 80; Page 126-128; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CBst in which Gln 371 is substituted by the ness of the material of the material of the material of the material of the material of the material of the material of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or reparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Claim 62. Page 117-119; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CL in which amino acids 379-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption of incomment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     No. Soup, 19310.9.

No. A benceding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis

for bone resorption control, esp. treatment of osteoporosis

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents offr-C21s in which the 21st Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has all molecular weight by SDS-PAGE of 60 kD under reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mutated OCIF, OCIF-C21S.
Osteoplastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.

Use the control, esp. treatment of osteoporosis for bone resorption control, esp. treatment of osteoporosis claim 32, Page 96-98, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C20S in which the 20th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and tharefore in the control of bone resorption of circum.
                                                                                                                                                                                                                                                                                                                                                                                           Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 41. Page 103-105, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C238 in which the 21rd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is absorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF 1s useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  National Section of the control, esp. treatment of osteoporosis for bone resorption control, esp. treatment of osteoporosis claim 38: Page 100-102, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents offr-C22s in which the 22nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               in the treatment and prevention of disorders of bone resorption, e.g.
